PROFESSIONAL SUMMARY

Blockchain engineer with 1+ year of production experience building smart contracts, cross-chain infrastructure, and DeFi protocol systems. Implemented a full UniswapX-compatible intent/reactor stack in Solidity paired with a high-throughput Rust + Axum RFQ service, shipped monitoring and historical-backfill integrations for 20+ bridge protocols across EVM, Cosmos, Move, Solana, Bitcoin, and Polkadot ecosystems, and contributed across the full stack of a production Web3 security platform. Comfortable from contract internals (Permit2, Dutch decay, reactor patterns) through Rust + Axum backend services to React + TypeScript front-end.

SKILLS

Languages: Solidity, Rust, TypeScript, JavaScript, Python, Java, SQL

Smart Contracts & Blockchain: Solidity, EVM Architecture, ERC-20 / 721 / 1155, UniswapX (Reactor Pattern, Dutch Decay), Permit2 Signature Flow, Cross-Chain Messaging, Bridge Protocol Integration, DeFi Protocol Integration, Gas Optimization, MEV Awareness, REVM, Flashbots, Alloy

Backend & APIs: Rust (Axum, Tokio, Tower, Hyper), Node.js, NestJS, Express.js, RESTful APIs, Microservices, Event-Driven Architecture, JWT Authentication, Circuit Breakers, Caching

Frontend: React.js, Next.js, Redux Toolkit, TypeScript-in-React, HTML5, CSS3, Tailwind CSS

Databases & Infrastructure: PostgreSQL, MongoDB, MySQL, Redis, Schema Design, Query Optimization, Indexing

Testing, Tools & DevOps: Foundry, Hardhat, Tenderly, Docker, Git, GitHub Actions, Postman, npm, Vite

PROFESSIONAL EXPERIENCE

System Analyst

Ancilar | Feb 2025 - Present | Indore, India

- Researched, scripted, and deployed protocol integrations for 20+ bridge protocols spanning EVM, Cosmos, Move, Solana, Bitcoin, and Polkadot ecosystems, delivering 212,000+ rows of historical bridge transaction data to production tables.
- Architected resumable, fault-tolerant historical backfill systems with progress checkpointing, classified retry handling (transient / semi-permanent / permanent), and idempotent upserts; built real-time monitoring agents handling cross-chain transfer events across EVM and non-EVM destinations (BTC UTXO indexing, Cosmos REST APIs, SUI Move events, Solana SPL transfers).
- Contributed across a Web3 security and monitoring platform spanning data ingestion, API services, and SDK definition layers, surfacing 5 independent production bugs through systematic unit-test coverage, including one silent-failure mode that would have broken monitoring across multiple non-EVM ecosystems.
- Diagnosed and resolved 3 substantive production issues in a single month (trigger-persistence logic, runtime crashes in custom monitoring modes, internal classification mismatches), closed 7 Jira tickets in a peak month, and led structured PR reviews across 8+ engineers spanning frontend, backend, data pipeline, and SDK code.
- Built UniTokenSwap, an internal UniswapX-compatible trading platform: authored the Solidity intent/reactor stack (BaseReactor, ExclusiveDutchOrder) and integrated it with a Rust + Axum RFQ service.

KEY PROJECTS

JobHunt - Full-Stack Job-Search Product

Personal project | Tech Stack: Python, FastAPI, PostgreSQL, JavaScript, Groq LLM | Live: jobhunt-8i1m.onrender.com

- Shipped a multi-user job-search product end to end: a data pipeline aggregating 10+ sources, an event-driven recommendation engine, and AI-assisted resume tailoring.
- Built an online personalization model from user events, multi-channel alerts (Telegram, email), and a self-healing scheduler resilient to free-tier cold starts.
- Owned backend, frontend, authentication, and deployment, applying the same systems rigor used for on-chain infrastructure.

Uniswap V3 Position Management Backend

Personal project | Tech Stack: TypeScript, Node.js, Ethers.js, REST APIs

- Built a 5-endpoint backend service for Uniswap V3 LP position management covering on-chain position state retrieval (liquidity, tick range, accumulated fees, position value), aggregation queries, and historical position endpoints.
- Engineered parallel RPC batching with response caching (reduced average response time ~70%), async timeout safety wrappers on all upstream calls, and real on-chain position-ID validation.
- Delivered clean REST contracts with structured error handling, request validation, Postman collection, and a detailed README and design-considerations doc.

Bingo Game - Multiplayer On-Chain Smart Contract Game

Personal project | Tech Stack: Solidity, ERC-20, Hardhat, ethers.js, React.js

- Developed a multiplayer on-chain Bingo game with random turn logic and ERC-20-based entry fees; modeled game state machine, on-chain settlement, and reward distribution logic.
- Wired event-driven frontend sync via contract events, resolving 100% of previously observed desynchronization issues between on-chain state and UI.
