PROFESSIONAL SUMMARY

Full-stack engineer with 1+ year of production experience building end-to-end web applications across React + TypeScript front-end and Node.js / NestJS back-end. Delivered production UI work on complex interactive interfaces (graph-based builders, dynamic forms, validation flows), built RESTful API services backed by PostgreSQL and MongoDB, and shipped a complete MERN application from schema to deployment. Comfortable owning a feature across the whole stack, from React components and state management through API contracts to database schema design.

SKILLS

Languages: TypeScript, JavaScript, Python, Java, Rust, Solidity, SQL

Frontend: React.js, Next.js, Redux Toolkit, TypeScript-in-React, Context API, React Hooks, Form Validation, HTML5, CSS3, Tailwind CSS, Responsive Design

Backend & APIs: Node.js, NestJS, Express.js, Rust (Axum), RESTful APIs, Microservices, Event-Driven Architecture, JWT Authentication, API Design & Integration, Caching

Databases & Infrastructure: PostgreSQL, MongoDB, MySQL, Redis, Schema Design, Query Optimization, Indexing, Docker

Testing, Tools & DevOps: Git, GitHub Actions, Postman, npm, Vite, Jest (familiar), Foundry

Blockchain & Web3: Solidity, EVM, ethers.js, Web3 integration, Smart Contract development

PROFESSIONAL EXPERIENCE

System Analyst

Ancilar | Feb 2025 - Present | Indore, India

- Built production front-end features in React + TypeScript across a complex platform UI, including custom node operators in a graph-based builder interface, form-state persistence fixes, validation-message handling, and JSON-body input controls.
- Developed back-end API services in NestJS and Node.js / TypeScript with clean REST contracts, request validation, and structured error handling, contributing across the full stack of a production monitoring platform (React front-end, NestJS API layer, Python data pipeline).
- Modeled and optimized PostgreSQL schemas with strategic indexing and query tuning, reducing query latency 30-40% and improving throughput under concurrent load.
- Completed a structured React + TypeScript upskilling program with daily mentor review covering hooks, Context API, Redux Toolkit, form validation, and TypeScript-in-React, then applied it directly to shipped production features.
- Surfaced 5 independent production bugs through systematic unit-test coverage, rolled out 3 substantive fixes within a single month, and reviewed pull requests across 8+ engineers spanning front-end, back-end, and data-pipeline code.

KEY PROJECTS

JobHunt - Full-Stack Job-Search Platform

Personal project | Tech Stack: FastAPI, Python, PostgreSQL, JavaScript, HTML/CSS, Groq LLM | Live: jobhunt-8i1m.onrender.com

- Built a complete product end to end: a FastAPI backend and a responsive vanilla-JS frontend (dark/light, mobile, hamburger nav), deployed live with authentication and a tracker dashboard.
- Implemented a learning recommendation engine and per-job resume tailoring with in-place .docx editing, plus multi-channel alerts (Telegram, email).
- Owned the full stack: job sourcing and matching, UI, a gamified application tracker, and deployment with cold-start resilience.
- Built a gamified, mobile-responsive UI (streaks, friends leaderboard, application funnel) and a per-job resume-tailoring flow with accept/reject suggestion cards and live ATS sub-scores.

Tomato - Full-Stack Food Delivery Application

Personal project | Tech Stack: React.js, Node.js, Express.js, MongoDB, JavaScript, REST APIs

- Planned, built, and tested a complete web application from scratch, covering both front-end and back-end using React.js, Node.js, and Express.js with an MVC structure.
- Created a RESTful API backend with clean API contracts, JWT-based authentication, request validation, and comprehensive error handling.
- Designed a MongoDB schema with strategic indexing on frequently queried fields (user_id, order_date, status), reducing query times by 30% and improving application responsiveness.

UniTokenSwap - Distributed Trading Platform

Ancilar internal initiative | Tech Stack: Node.js, TypeScript, Rust, Axum, PostgreSQL, Solidity, Docker, REST APIs

- Engineered backend API services across User, RFQ, Quoter, and Settlement microservices with clean REST contracts, request validation, and comprehensive testing and documentation.
- Modeled PostgreSQL schemas for intent ingestion, quote lifecycle, and settlement state machines, applying indexing and caching strategies that reduced database load by 40%.
- Wired event-driven workflows with retry logic, idempotent upserts, async timeout safety, and fault isolation across inter-service communication, achieving sub-100ms API response times under concurrent load.
